**Hay And Silage Product Applicator System**

**System Overview**
This project is an agricultural system for applying hay and silage preservatives at the time of bailing or swathing. This system provides a solution which enables customers to have better automated control, monitoring, and flexibility over the flow rates at which product is applied to their crops.

**Conclusion**
Many obstacles were encountered in both hardware and software segments of this project. Simply getting the project to function could not be the only end goal. This was a real world implementation that required the finished product to be robust, user friendly, versatile for a large range of applications, and of a professional quality. This system was presold to close to 50 customers prior to the completion of the project.
